

GoodSecurity Penetration Test Report

EmilyFactor@GoodSecurity.com

April 29, 2022

1. High-Level Summary

GoodSecurity was tasked with performing an internal penetration test on GoodCorp's CEO, Hans Gruber. An internal penetration test is a dedicated attack against internally connected systems. The goal of this test is to perform attacks similar to those of a hacker and attempt to infiltrate Hans' computer to determine if it is at risk. GoodSecurity's overall objective was to exploit any vulnerable software, find a secret recipe file on Hans' computer, and report the findings back to GoodCorp. The internal penetration test found several alarming vulnerabilities on Hans' computer: When performing the attacks, GoodSecurity was able to gain access to his machine and find the secret recipe file by exploiting two programs with major vulnerabilities. The details of the attack are below.

2. Findings

Machine IP:

[192.168.0.20](#)

Hostname:

[MSEDGEWIN10](#)

Vulnerability Exploited:

[Icecast Header Overwrite](#)

Vulnerability Explanation:

[This vulnerability is severe. The icecast application exploits a buffer overflow in the header. This allows an attacker to execute arbitrary code on the remote host with the privileges of the Icecast server. Sending 32 HTTP headers to the remote host to overwrite a return address on the stack. \(www.tenable.com/plugins/nessus/14843\)](#)

Severity:

In your expert opinion, how severe is this vulnerability?

Critical! 10.0

3. Recommendations

Upgrading your icecast to the latest version 2.0.2 or later. Applying patches to resolve all vulnerabilities. Conduct regular updates to the system and verify patches have been implemented. Also updating patches on a monthly basis.
